Version 3.1

1 Blogging

The new blog mode allows you to turn a space blog into a "real" blog in terms of behavior and design. The look and feel can easily be customized and sharing to Twitter, Facebook and Google is just a click away. The blogs are easy to access through the new namespace: www.yourwiki.com/blog. The navigation between different blog posts are improved with a new calendar and with next / previous buttons.

2 Categories

2.1 We have made three big improvements to the category menu:

1. Category and space logos can now be displayed in the menu.

2. An automatic horizontal scroll will appear when there are too many categories.

3. Introducing a dynamic category mode. The size of the drop down will adjust to the number of subcategories and spaces in each category.

2.2 Default design on categories

Designs doesn't need to be assigned to every category.

3 Activity Stream

3.1 Activity stream popup

The activity stream is accessible from any page in your wiki. Access it through the top menu or by the keyboard shortcut A (shift + a).

3.2 Popular and network tab added

Popular and network tabs are added to the activity feed (Activity stream) on the dashboard and to the popup.

3 Read blog posts in popup

Blog posts can now be read without leaving the page.
4 Improved admin UI

The admin UI is more solid and consistent. Sorting items is done with drag and drop.

5 Group permissions on top menu items.

View permission can now be granted to groups on custom top menu items.

6 Front end improvements

We have done a lot of under the hood changes. Basically all of our front end functions like categories, blogs and macros are now loading its data from our REST API. This makes the UI nice and quick. We are also adding the HTML5 article tag to all pages and blog posts. The article tag is used by a lot of devices to display a more readable view of the content.

7. Bug fixes

<table>
<thead>
