Caching in Refined

Background

When you have a large instance with many spaces or a lot of simultaneously active users, or you just want to speed things up, we recommend turning on the caching feature.

An enabled cache will make the server requests related to Refined fewer by storing the UI settings locally in the browser using the Web Storage API. This will decrease the amount of server requests and greatly improve page load times for all users.

Enabling cache

Go to Theme Configuration > Caching.
Enable Cache, then check all boxes.
The cache will be automatically invalidated on any action that would invalidate it.

You can manually force this to happen by using the buttons "Clear Cache" and "Clear Server Cache".

An invalidation of the cache will make the browsers re-fetch the information the first time a user visits a page again.
